

TARGETING SYSTEM · monkeygod.us

ULTIMATE GIRLS ONLY METHOD.

Gender recognition filter — 95%+ female matches.

- How the AI gender recognition pipeline actually works
- Full setup: Chrome · Firefox · Yandex · Orion — any device
- Demo Mode vs Premium Mode — exactly what each one gives you
- Optimal settings for 95%+ female matches
- Ban avoidance — the complete guide for filtered sessions
- Best time windows and the VPN timezone stack
- Advanced tips that push results further
- Video tutorial link + direct extension links

01 —

HOW GENDER RECOGNITION WORKS

A browser extension runs a real-time AI model on the incoming webcam stream of every match. It analyzes facial features, hair, and body shape frame by frame, classifies the match as male or female, and acts on that classification automatically — all before you have said a single word.

INVISIBLE TO THE OTHER PERSON — The extension never touches the outgoing stream. It only reads the incoming feed. The other person has no idea the filter is running.

THE RECOGNITION PIPELINE

1	Frame Capture Every incoming video frame is sampled at the interval you set (1000ms = once per second). Lower interval = faster detection, higher CPU usage. 1000ms is the sweet spot — fast enough to catch males within the first second, light enough to run alongside the chat platform without lag.
2	Face Detection The AI locates a face in the frame using a lightweight object detection model. If no face is detected — match is dark, off-camera, or has no clear face — the extension holds the connection and does not skip. It only acts when it has a confident face to classify.
3	Gender Classification The detected face runs through a binary classifier trained on millions of labeled images. It outputs a confidence score from 0–100%. 100% = highly confident male. 0% = highly confident female. Scores in the middle are "uncertain" and the extension waits for more frames.

4	Threshold Check Your threshold setting (recommended: 60%) is the minimum confidence score required to trigger an action. A score of 59% = no action, stays connected. A score of 60%+ = triggers the auto-skip. Higher threshold = fewer false skips but may let some males through. 60% is the tested optimum.
5	Auto-Action Male detected above threshold: skip executed automatically, next match loads immediately. Female or uncertain score: stays connected — you never see the male at all. Overall misclassification rate is approximately 5%, meaning roughly 1 in 20 connections may need a manual skip. This is normal and improves as the AI updates.

02 —

FULL SETUP — EVERY DEVICE

The extension requires a browser that supports extensions. Regular Safari and default iOS Chrome do not support extensions — you need the right browser for your device. Setup takes under 2 minutes regardless of device.

PC / DESKTOP (CHROME) — RECOMMENDED

1	Download Chrome If you do not have it: google.com/chrome — install it. Chrome is required on desktop. Edge and Brave also work since they are Chromium-based and support the same extension.
2	Install the Extension Go directly to this link in Chrome: https://chromewebstore.google.com/detail/videochat-extension-ip-lo/alchldmijhnnapijdmchpkdeikibjgoi Click "Add to Chrome" → "Add extension" in the confirmation popup. The extension icon appears in the top-right toolbar. If you do not see it, click the puzzle piece icon and pin it.
3	Open Your Chat Platform Navigate to your chat platform (Omele, OmeTV, etc.) in the same Chrome window. Within a few seconds, a floating panel appears in the bottom-right corner of the page. This is the extension control box.

4	Open the Gender Filter Click the group/people emoji icon (👤) in the extension panel. This opens the Gender Filter tab. You will see toggle switches and number inputs.
5	Apply the Settings Set exactly: Ban Men → ON. Skip Men → ON. Skip Women → OFF. Gender Confirmation → 1000. Threshold → 60. Confirm → 1d (the lowest/leftmost option). See Section 03 for a full breakdown of what each setting does.
6	Refresh and Go Refresh the browser tab. The filter is now active. Every new match gets analyzed automatically. You do not need to click anything during the session — it runs in the background.

IPHONE / iPad (YANDEX BROWSER — BEST OPTION)

Standard Chrome and Safari on iOS do not support third-party extensions. Yandex Browser is the best workaround — it runs on Chromium and supports Chrome extensions natively on iOS. Orion Browser is an alternative.

1	Download Yandex Browser Search "Yandex Browser" on the App Store. Free download. Install and open it.
2	Enable Extensions Tap the three-line menu (bottom right) → Settings → Extensions. Enable the extensions toggle if it is not already on.
3	Install from Firefox Add-on Store In Yandex Browser, navigate to: addons.mozilla.org/en-US/firefox/addon/videochat-extension-ip-locator/ Tap "Add to Firefox" — Yandex will install it as a compatible extension. Alternatively, search "Videochat Extension IP Locator" in the Yandex add-on catalog.

4

Follow PC Steps 4–6

The extension interface inside Yandex Browser is identical to Chrome. Open your chat platform, find the extension panel bottom-right, configure the Gender Filter settings, and go.

ANDROID (FIREFOX)

1

Download Firefox for Android

Available on the Google Play Store. Standard Firefox on Android supports extensions — Chrome on Android does not. Install Firefox and open it.

2

Install the Extension

In Firefox: tap the three-dot menu → Add-ons → tap the search icon → search "Videochat Extension IP Locator for Omegle". Tap "Add to Firefox". Or go directly to:
addons.mozilla.org/en-US/firefox/addon/videochat-extension-ip-locator/

3

Follow PC Steps 4–6

The extension interface is identical across all browsers once installed. Open the chat platform, find the extension panel, set Ban Men ON, Skip Men ON, Skip Women OFF, refresh, done.

PC IS OPTIMAL — PC gives the best experience: faster CPU for the AI model, larger screen, better webcam quality, and no battery drain. Use PC when you can. Mobile works but match quality is slightly lower due to camera constraints.

02.5 —

EXTENSION MODES — DEMO vs PREMIUM

The extension has two tiers. The Demo (free) version is fully functional for gender filtering. Premium adds advanced targeting and analytics on top. Here is exactly what you get with each.

DEMO MODE — FREE

- ✓ Install directly from Chrome Web Store — no account, no payment, no time limit

GENDER FILTER (FULLY ACTIVE IN DEMO):

- ✓ Ban Men toggle — blocks flagged males from reconnecting to you
- ✓ Skip Men toggle — auto-skips male matches in real time before they load fully
- ✓ Skip Women toggle — set to OFF to keep all female connections
- ✓ Gender Confirmation interval — set how often the AI checks (1000ms recommended)
- ✓ Threshold % — set the minimum confidence to trigger a skip (60% recommended)
- ✓ Confirm/Duration setting — set to 1d (lowest) for fastest single-detection skip
- ✓ The full AI gender recognition pipeline runs at 100% — no feature reduction in demo

WHAT DEMO DOES NOT INCLUDE:

- ✓ IP Locator overlay (country/city of each match)
- ✓ Country flags displayed on matches
- ✓ Full session statistics dashboard (skip count, match count, skip rate %)
- ✓ Country/region targeting filter (filter by specific country)

PREMIUM MODE — ~\$5 ONE-TIME PAYMENT

- ✓ Paid once inside the extension — click the "Upgrade" or crown icon in the extension popup
- ✓ One-time payment only — not a subscription, does not expire

EVERYTHING IN DEMO, PLUS:

- ✓ IP Locator overlay — shows each match's country and city in real time as you connect
- ✓ Country flag display — flag icon appears on every match connection showing their origin
- ✓ Full session statistics — total matches seen, males skipped, females stayed, skip rate % for the session
- ✓ Country/region filter — set the extension to only connect to matches from specific countries (e.g. US, UK only)
- ✓ Stats history — track performance across multiple sessions

HOW TO UPGRADE:

- ✓ Open the extension popup while on any chat platform
- ✓ Click the crown icon or "Go Premium" button in the top section of the panel
- ✓ Complete the one-time payment inside the extension interface
- ✓ Premium features unlock immediately — no restart required

VERDICT: Start with Demo. The gender filter works identically in both modes. Upgrade to Premium if you want to see where matches are from and filter by country. For most users, Demo is all you need to hit 95%+ female match rates.

03 —

OPTIMAL FILTER SETTINGS

The default settings work but these are the values tuned for maximum accuracy with minimum false skips. Copy these exactly. Explanation of what each setting does is in the right column.

SETTING	VALUE	WHAT IT DOES — FULL EXPLANATION
---------	-------	---------------------------------

Ban Men	ON	Adds detected males to a session block list so they cannot reconnect to you during the same session. Without this, a skipped male could pop up again seconds later.
Skip Men	ON	The core toggle. Enables the auto-skip function. When a male is detected above the threshold, the extension immediately triggers a skip to the next match. Turn this OFF and the extension becomes passive (shows warnings only).
Skip Women	OFF	Keeps all female connections — never auto-skips them. Keep this OFF. If you turn it ON, the extension will skip both males and females, which defeats the purpose entirely.
Gender Confirmation (Interval)	1000ms	How often the AI samples a frame from the incoming video. 1000ms = once per second. Lower values (500ms) = faster detection but higher CPU usage. Higher values (2000ms) = slower detection, males may show briefly. 1000ms is the tested sweet spot for most hardware.
Threshold	60%	The minimum AI confidence score to trigger a skip action. At 60%, a match needs to score 60% or higher on the male classifier before being skipped. Below 60% = uncertain, stays connected. Lower threshold (40%) = more aggressive, may skip some androgynous women. Higher threshold (80%) = more conservative, may let some males through briefly. 60% is optimal.
Confirm (Duration)	1d (lowest)	How many confirmations needed before the skip fires. 1d = skip fires on the very first confident detection, no waiting. Higher values = extension waits for multiple consecutive detections before acting. Use 1d for maximum speed — you want the skip to happen in under 1 second of seeing a male.

DEMO vs PREMIUM NOTE: All six settings above are fully available and fully functional in the free Demo version. You do not need to pay to access the gender filter. Premium adds the IP overlay, country flags, statistics, and country targeting — not the filter itself.

The gender filter gets you matched with women. These rules keep you from getting flagged while you are there. The platform AI is less strict than Monkey App but it still bans. Follow all of these — not just some of them — and sessions last indefinitely.

VISUAL & CLOTHING

- ✓ Dark lighting or cover — low light or a blanket prevents the AI from making a confident classification. The detection model needs clear skin contrast to classify. Remove that contrast and detections drop significantly.
- ✓ Avoid showing your torso or stomach — this is the largest exposed skin surface and the highest-confidence detection signal. Keep the camera frame from chest up only.
- ✓ Keep the camera angle tight — chest-up or waist-up. Less surface for the AI to analyze per frame.
- ✓ Wear dark clothing — black or dark grey specifically. Reduces the skin-tone contrast the AI uses to isolate exposed regions.
- ✓ Cover your lower half with a blanket or dark clothing if anything below the waist might be visible. Covered items read as ambiguous. Uncovered ones do not.

CAMERA & MOVEMENT

- ✓ Never hold the camera — set it on a fixed surface. Handheld movement creates a shaking signature that the detection system flags as erratic behavior.
- ✓ Find your locked angle before the session starts and do not change it mid-session. Angle changes mid-session can trigger re-analysis and flag the transition.
- ✓ Slow, deliberate movements only — fast motion is flagged as evasion behavior on most detection models. Move naturally and slowly if you move at all.
- ✓ Avoid erratic or sudden movements — this is a secondary ban trigger on top of visual classification.

TEXT & ACCOUNT

- ✓ Never type explicit words in the chat text box — the platform runs an NLP filter on all text input in parallel to the video AI. A combined text + video trigger dramatically increases ban probability.
- ✓ No explicit or sexual display names — account names are checked when report counts accumulate on your IP. Use a first name or a neutral word.
- ✓ If banned: VPN immediately — the ban system is IP-based only. A VPN with a new IP = clean slate. See Guide 02 (Elite Unban Method) for the full VPN procedure.

THE SETUP THAT LASTS: dark lighting + covered lower half + tight camera frame + dark clothing + text box left empty. All five together. Not three out of five.

05 —

BEST TIMES

WINDOW	RATING	WHY IT WORKS
Nightly 9PM – 1AM	★★★★★ PEAK	Late-night boredom = highest activity across all demographics. Largest female pool on the platform at any given point in the day. This is the primary window — prioritize it above everything else.
Weekdays 3PM – 6PM	★★★★ HIGH	After-school and after-college crowd. Large active pool of 16–22 year olds. Activity ramps up fast from 3PM and sustains through 6PM before dinner hour drops it.
Weekends All Day	★★★★ HIGH	No school or work = elevated activity throughout the day. Starts at ~11AM and sustains until 2AM. No single peak — consistent volume across the entire day.
Weekday Mornings 8AM – 2PM	★★ LOW	Work and school hours. Pool is thin and skews heavily male. Not worth a full session. Use for quick spot checks only.
2AM – 8AM Any Day	★ VERY LOW	Minimal active users. What little traffic exists skews male and international. Not worth running the filter during this window — insufficient pool to generate quality matches.

TIMEZONE TRICK: Connect your VPN to a US East Coast state (New York, Florida, Georgia) and the platform routes you into that region's active pool. If it's 3PM where you are but 9PM on the East Coast, you access peak-hour traffic regardless of your actual timezone. This works because the platform assigns match pools based on the IP's geographic location.

06 —

ADVANCED TIPS

These are the multipliers. Each one works on its own. Run them together and the compounding effect is significant.

- **Stack the filter with the VPN timezone trick** — gender filter + late-night East Coast timezone = the single highest-output combination in this guide. Both run simultaneously with no conflict.
- **Use interests/tags to narrow the pool before the filter even runs** — enter interest tags like: fashion, music, astrology, mental health, relationships, art, nails. These filter the incoming pool toward female-skewing users before the AI extension even sees the match.
- **Let the filter run — do not manual-skip** — the extension processes each frame faster than you can react. Manual skipping interrupts the classification cycle and forces the extension to restart detection on a fresh match instead of having pre-loaded data. Leave your hands off the skip button.
- **Ring light or lamp facing you** — good lighting on your side dramatically increases match retention. When the other person can see you clearly and you look good, they stay connected. A basic ring light is a \$15–20 investment that outperforms any other single upgrade.
- **Mute mic on entry** — start visual-only. Prevents audio flags, reduces the nervous energy that causes girls to skip immediately, and gives you a second to read the match before they hear you.
- **Close other tabs and apps** — the extension's AI model runs in-browser and competes for CPU resources. Every background tab and open application reduces frame-processing speed. Give it full bandwidth for best performance.
- **Keep sessions to 45–90 minutes max** — extended sessions in a single sitting accumulate report weight on your IP. Multiple shorter sessions with breaks are safer than one marathon session.
