

UNBAN SYSTEM · monkeygod.us

ELITE UNBAN METHOD.

IP swap. New IP = no ban. Works every time, unlimited times.

- What these platforms actually track — and what they cannot track
- Full VPN comparison: paid and free options side by side
- WebRTC leak fix — the VPN bypass most people miss
- Platform-specific recovery steps for OmeTV, Monkey, MiniChat, Chatroulette, Emerald
- Troubleshooting — still banned after VPN? Full diagnostics
- IP verification tools to confirm clean status before going live

WHAT THESE PLATFORMS ACTUALLY TRACK

Before running the unban system, understand what the ban is based on. These platforms ban one thing: your IP address. Everything else you might think they track, they do not. This is what makes the system work every single time.

DATA TYPE	TRACKED?	WHY
IP Address	YES — THE ONLY ONE	Every connection carries your public IP. The platform logs it on every session start. When a ban fires, it logs against this IP. A new IP = a new user, unrecognized, with no ban history.
Device ID / Fingerprint	NO	Platforms like OmeTV and Omegle use IP-only tracking. Device identifiers are not logged or cross-referenced. The same phone or computer with a new IP appears completely clean to the system.
Account Data	PARTIAL	Account credentials on account-based platforms (Monkey App, MiniChat) are tied to ban records. But the account ban is only enforced when your IP matches a flagged account. VPN + new account = full recovery on account-based platforms.
Browser History	NO	No browser history is accessed. Only the active session IP matters. Clearing cookies is sometimes helpful (session token cleanup) but history is never read.
Phone Number	RARELY	Phone numbers are not used for ban enforcement on any of the platforms in this system. Some platforms request phone verification during account creation but do not use it for ban tracking.

CONCLUSION: Get a new IP and your ban is gone. That is the entire unban system. Everything else in this guide exists to make sure you actually get a new IP and that the new IP is clean and verified.

VPN COMPARISON — PAID AND FREE

VPN	COST	NOTES
Surfshark	~\$2.50/month (best value)	MonkeyGod recommended. Unlimited simultaneous device connections — one subscription covers every device you own. Fast servers, built-in kill switch that cuts internet if VPN drops (prevents accidental IP exposure), verified no-logs policy. Best all-around value for active users running multiple sessions.
NordVPN	~\$4/month	3,000+ servers across 60+ countries. Consistently fast connections with low latency. Good for users who rotate between many server locations quickly. Strong reputation, verified no-logs, reliable kill switch.
ExpressVPN	~\$8/month (most reliable)	Most consistent uptime and connection reliability of any VPN on this list. Highest price point. Worth it if you are running sessions where connection drops are unacceptable. Fast servers, broad coverage, strong privacy.
Proton VPN (Free tier)	FREE	Unlimited bandwidth on the free tier — no data cap, no time limit. Slower than paid options on free servers (US, Netherlands, Japan). Sufficient for the unbun system and for testing the setup before committing to a paid plan. No credit card required for free tier.
Windscribe (Free tier)	FREE (10GB/month)	10GB per month on free tier — sufficient for occasional sessions. Solid privacy policy. Good as a backup if Proton is slow. windscribe.com — no credit card for free signup.

WEBRTC LEAK FIX — THE VPN BYPASS

This is the most common reason the unbun system fails after someone correctly connects a VPN. WebRTC is a browser technology that enables real-time video and audio — the same technology these chat platforms run on. The problem: WebRTC can expose your real IP address directly to the platform even when your VPN is active. Fix this before every session.

TEST FIRST: With your VPN connected, go to browserleaks.com/webrtc — if your real IP appears under "Your IP addresses" alongside the VPN IP, you have a WebRTC leak. Fix it with the steps below before starting any session.

BROWSER	FIX
Chrome / Edge	Install "WebRTC Control" extension from the Chrome Web Store (search exactly: WebRTC Control). Click the extension icon after install — the icon turns red when WebRTC is blocked. Enable it once and it persists across browser restarts. WebRTC leak stops immediately. Verify at browserleaks.com/webrtc after enabling.
Firefox	Type <code>about:config</code> in the address bar → press Enter → accept the warning. Search <code>media.peerconnection.enabled</code> in the search box. Double-click the result to toggle it from true to false. Close the tab. WebRTC is now fully disabled in Firefox. No extension needed — this is a native browser setting.
Safari	WebRTC is not enabled by default in Safari on macOS or iOS. No fix needed unless you have manually enabled it through developer settings. If you are unsure, verify at ipleak.net — no real IP appearing means no leak.
Mobile (iOS / Android)	Use your VPN app's built-in leak prevention setting. Surfshark: Settings → VPN Protocol → enable "Kill Switch". Proton VPN: Settings → enable "Leak Prevention". On mobile, also verify at browserleaks.com/webrtc in the browser you use for the platform.

04 —

PLATFORM-SPECIFIC RECOVERY

Each platform has a slightly different recovery procedure. The VPN handles the IP change — these steps handle the session cleanup that ensures the new IP starts clean.

PLATFORM	RECOVERY STEPS
OmeTV (ome.tv)	1. Connect VPN to US server. 2. Verify new IP at whatismyip.com . 3. Clear browser cookies for ome.tv (browser Settings → Privacy → Cookies → find ome.tv → delete). 4. Reload ome.tv. Done — session starts fresh. OmeTV is IP-ban only, no account needed.
Monkey App (Mobile)	1. Connect VPN. 2. Delete the Monkey app completely from your device. 3. Reinstall from the App Store or Play Store. 4. Create a fresh account with a new email. 5. Open with VPN still connected. The reinstall clears all local session data. New account + new IP = full recovery.

MiniChat	1. Connect VPN. 2. Clear browser cookies for minichat.com or clear app data if using the app. 3. Create a new account with a fresh email address. 4. Load MiniChat with VPN active. MiniChat uses both IP and account bans — new account is required, not optional.
Chatroulette	1. Connect VPN to a US server. 2. Clear browser cookies for chatroulette.com (or open in incognito tab). 3. Navigate to chatroulette.com. IP-based ban system. Cookie clearing prevents the session token from carrying over. Incognito mode handles this automatically.
Emerald Chat (emeraldchat.com)	1. Connect VPN. 2. Create a new account with a fresh email address. 3. Clear cookies for emeraldchat.com or use incognito. 4. Open with VPN active. Emerald uses account-based bans primarily. New account is mandatory — IP change alone is insufficient.

05 —

TROUBLESHOOTING — STILL BANNED?

SYMPTOM	CAUSE	FIX
VPN connected but still banned	WebRTC leak exposing real IP through the browser despite VPN being active.	Fix WebRTC using Section 03 steps for your browser. Verify at browserleaks.com/webRTC that real IP no longer appears.
New IP, still getting immediately banned	The VPN server's IP is on a shared blacklist — many VPN users previously got banned from this exact IP.	Disconnect and reconnect to a different server location. Try a city in a different US state. Keep switching until you get a clean IP.
Banned 5 minutes after connecting	Session cookies from previous banned session are still present in the browser.	Clear all cookies for the platform domain. Use incognito/private mode which clears cookies automatically on close.
IP shows US but still thin match pool	Connected to a low-traffic server region or off-peak hours.	Switch to East Coast US server specifically (New York, Virginia, Florida). Run during 9PM–1AM window.

VERIFICATION TOOLS: whatismyip.com (confirm current IP and location) · ipleak.net (full leak test including WebRTC) · browserleaks.com/webrtc (WebRTC-specific leak test). Use all three if you are troubleshooting a persistent ban.
